

Open VIA either in the web browser or as a program. Enter the Design tab. This may have to be enabled in the settings. (Show Design Tab)

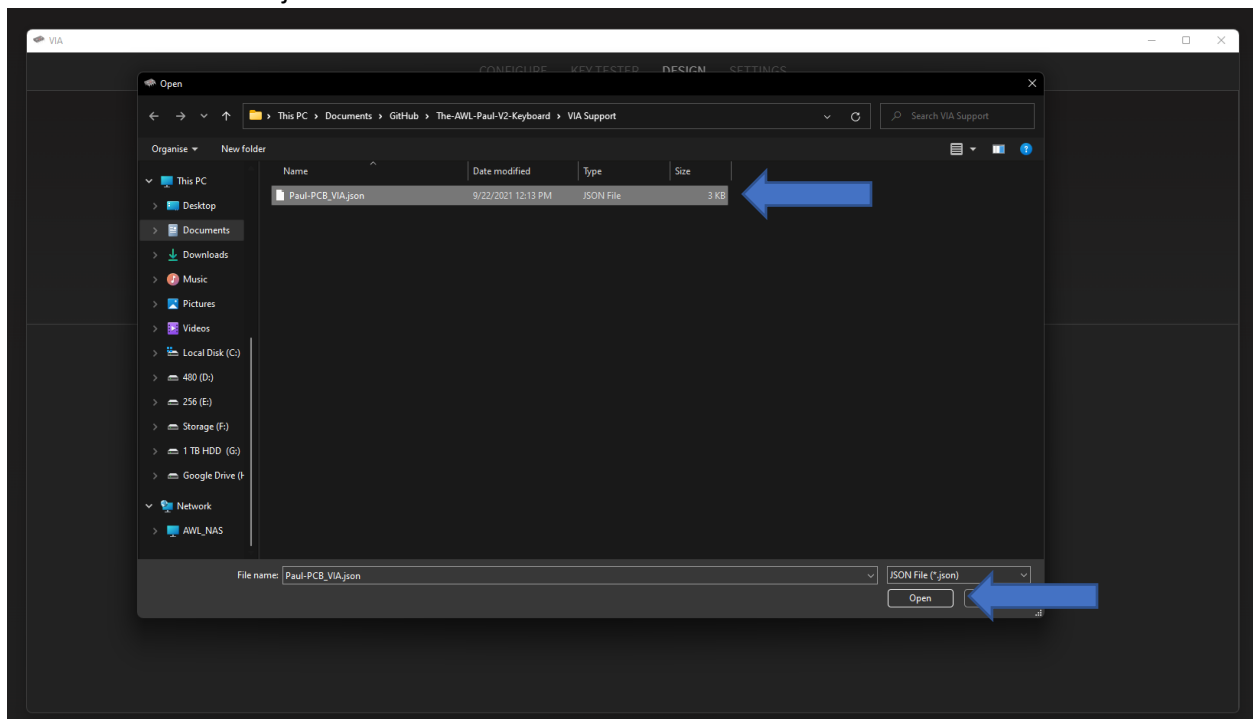

Turn off << Use V3 definitions (VIA/Next) >>

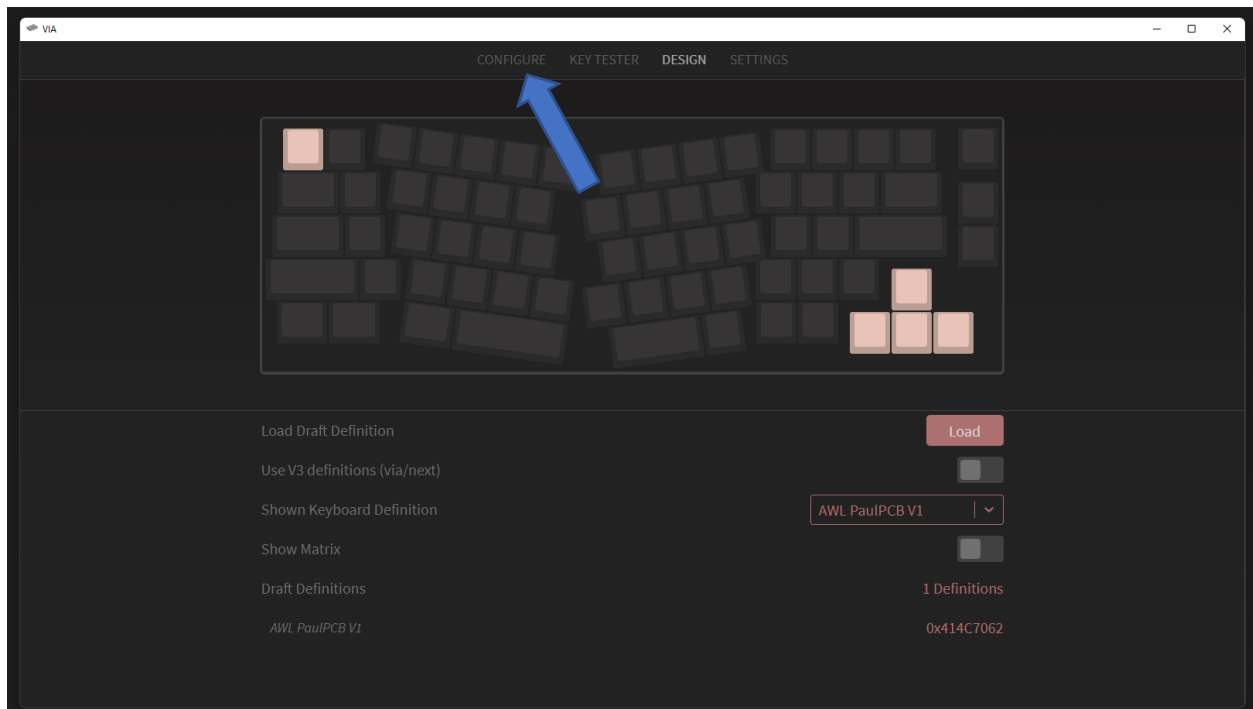

Click Load

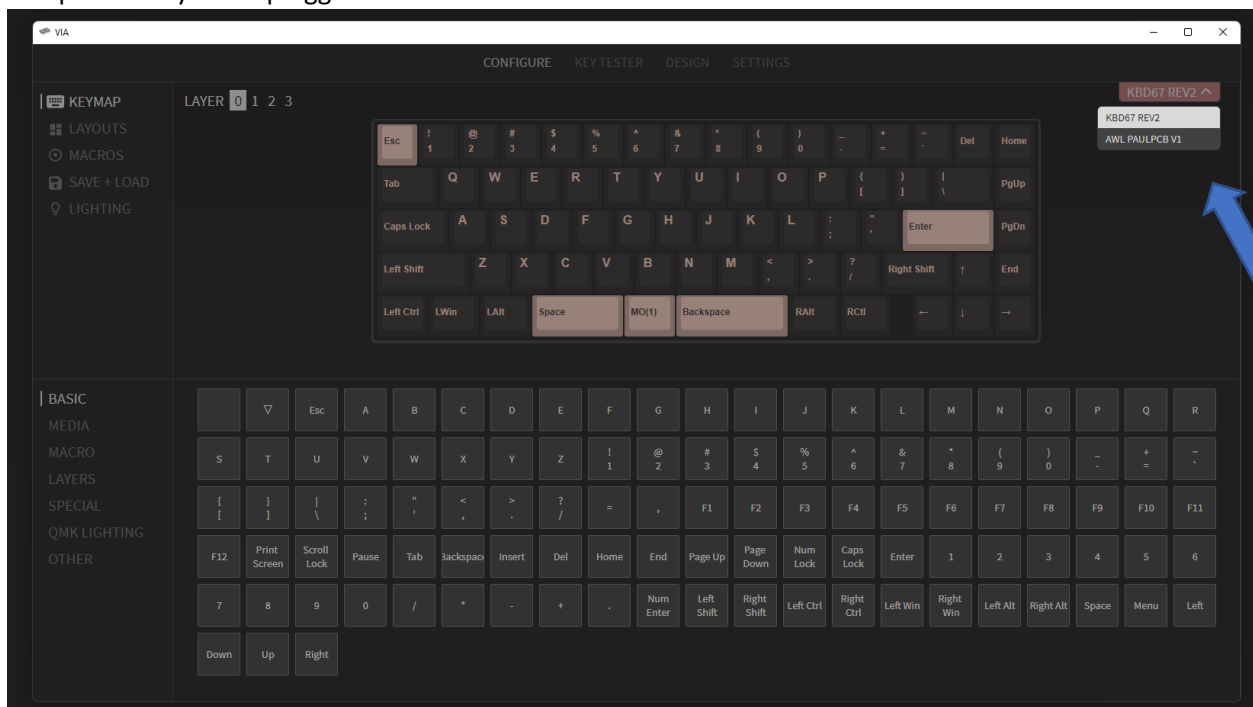

Load the Paul-PCB-VIA.json file that can be found on the GitHub.

This screen should now show.

Head back to the configure tab. You may have to switch keyboards if you have more than one VIA compatible keyboard plugged in.

Continue to configure as you would for any other keyboard in VIA. This process may have to be repeated upon a computer restart. I would like to eventually gain official VIA support however this project has been lower priority since I graduated university and took up a full time job. Thanks for your involvement with this project. It was a labor of love...
